Current project board — evidence, remaining actions, and boundaries

This is a current-state submission board, not a reconstructed or fabricated Trello history.

Done in the repository when the listed evidence is present

Work item	Evidence path	Status / boundary
Source audit	`reports/source_audit.json`, `data/collection_metadata.json`	Supplied stages: 64,237 raw / 17,354 interim / 15,621 labeled rows.
Reproducible cleaning	`src/cleaning.py`, `reports/cleaning_report.json`	47 quarantined; 15,574 cleaned rows.
EDA and figures	`src/analysis.py`, `reports/figures/`, `notebooks/01_random_forest_project.ipynb`	Descriptive source analysis.
Group-safe feature pipeline	`src/experiments.py`, methodology	Top 1,500 train-fold ingredient presence + log1p count; no categories/brands.
Model comparison and RF tuning	`reports/tables/`, `reports/final_metrics.json`	RF is the selected ensemble-focused model; benchmark leader remains separately reported.
Internal grouped evaluation	`reports/final_metrics.json`, `reports/FINAL_RESULTS.md`	12,459/3,115 rows; zero exact formula-group overlap; not external validation.
Scope sensitivity, if run	`reports/final_metrics.json`	6,785 rows; overlapping-source sensitivity only.
Executed analysis notebook	`notebooks/01_random_forest_project.ipynb`, `reports/execution_summary.json`	43 notebook cells, 24 executed code cells, 0 error outputs, 15 embedded PNG figures.
Automated tests	`reports/test_results.txt`	23 passed.
Public-facing documentation	`README.md`, `docs/`, `FINAL_SUBMISSION.md`	Generated dynamically from the final RF metrics.

Blocked or intentionally not claimed

- The exact 16-substance registry, matching rules, source versions, and original label-generation code are missing. No deterministic matching score or masking experiment is claimed.
- Independent external validation, calibrated personal-risk probabilities, concentration/exposure modeling, OCR, hosted deployment, and a full regulatory workflow are not complete and are not claimed.
- MDI feature importance is not directional or toxicological. Local explanation is drop-one probability perturbation, not SHAP.

User actions required before submission

1. Read the minimal hand-in checklist and review the RF notebook, code, charts, and final metrics.
2. Run the documented commands and resolve any failures visible in test evidence.
3. Create or update the **new GitHub repository** yourself and verify the default branch contains the RF notebook and final documentation. This workspace does not claim GitHub is already updated.
4. Use the final slides delivered separately, obtain the actual share URL, and enter it where required. Do not add a broken presentation link to the public repository.
5. Paste the verified repository URL in Student Portal and follow cohort policy for authorship, assisted code, and disclosure.

No jury Q&A or speaker notes are included in the public repository.
